Preface

This Handbook of Dermatology is intended for senior medical students and newly qualified doctors.

For many reasons, including modern medical curriculum structure and a lack of suitable patients to provide adequate clinical material, most UK medical schools provide inadequate exposure to the specialty for the undergraduate. A basic readable and understandable text with illustrations has become a necessity.

This text is available online and in print and should become essential reading. Dr Chiang is to be congratulated for her exceptional industry and enthusiasm in converting an idea into a reality.

Julian Verbov
Professor of Dermatology
Liverpool 2020

Preface to the 3rd edition

10 years have passed since this Handbook first appeared. It has proved immensely popular and it had been further updated.

We hope that it will continue to be a valuable source book for those interested in learning about this exciting specialty.

The Handbook was designed to be comprehensive but also both succinct and reader-friendly which continues to be our aim.

Once again many thanks to the BAD for its essential and continuing support.

Julian Verbov
Professor of Dermatology
Liverpool 2020
Foreword to First edition

There is a real need for appropriate information to meet the educational needs of doctors at all levels. The hard work of those who produce the curricula on which teaching is based can be undermined if the available teaching and learning materials are not of a standard that matches the developed content. I am delighted to associate the BAD with this excellent handbook, designed and developed by the very people at whom it is aimed, and matching the medical student and junior doctor curriculum directly. Any handbook must meet the challenges of being comprehensive, but brief, well illustrated, and focused to clinical presentations as well as disease groups. This book does just that, and is accessible and easily used. It may be read straight through, or dipped into for specific clinical problems. It has valuable sections on clinical method, and useful tips on practical procedures. It should find a home in the pocket of students and doctors in training, and will be rapidly worn out. I wish it had been available when I was in need, I am sure that you will all use it well in the pursuit of excellent clinical dermatology!

Dr Mark Goodfield
President of the British Association of Dermatologists
What is dermatology?

- Dermatology is the study of both normal and abnormal skin and associated structures such as hair, nails, and oral and genital mucous membranes.

Why is dermatology important?

- Skin diseases are very common, affecting up to a third of the population at any one time.

- Skin diseases have serious impacts on life. They can cause physical damage, embarrassment, and social and occupational restrictions. Chronic skin diseases may cause financial constraints with repeated sick leave. Some skin conditions can be life-threatening.

- In 2006-07, the total NHS health expenditure for skin diseases was estimated to be around £97 million (approximately 2% of the total NHS health expenditure).

What is this handbook about?

- The British Association of Dermatologists outlined the essential and important learning outcomes that should be achieved by all medical undergraduates for the competent assessment of patients presenting with skin disorders (available on: http://www.bad.org.uk/library-media/documents/(Link2)%20Core%20curriculum(2).pdf).

- This handbook addresses these learning outcomes and aims to equip you with the knowledge and skills to practise competently and safely as a junior doctor.
Essential Clinical Skills

• Detailed history taking and examination provide important diagnostic clues in the assessment of skin problems.

Learning outcomes:
1. Ability to take a dermatological history
2. Ability to explore a patient’s concerns and expectations
3. Ability to interact sensitively with people with skin disease
4. Ability to examine skin, hair, nails and mucous membranes systematically showing respect for the patient
5. Ability to describe physical signs in skin, hair, nails and mucosa
6. Ability to record findings accurately in patient’s records

Taking a dermatological history

• Using the standard structure of history taking, below are the important points to consider when taking a history from a patient with a skin problem (Table 1).

• For dark lesions or moles, pay attention to questions marked with an asterisk (*).

Table 1. Taking a dermatological history

<table>

Examine the skin

- There are four important principles in performing a good examination of the skin:
  INSPECT, DESCRIBE, PALPATE and SYSTEMATIC CHECK (Table 2).

Table 2. Examining the skin

<table>
<thead>
<tr>
<th>Main principles</th>
<th>Key features</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>INSPECT in general</strong></td>
<td>General observation</td>
</tr>
<tr>
<td></td>
<td>Site and number of lesion(s)</td>
</tr>
<tr>

<tr>
<td></td>
<td><strong>M</strong>orphology, <strong>M</strong>argin (border)</td>
</tr>
</tbody>
</table>

*If the lesion is pigmented, remember **ABCD**

*(the presence of any of these features increase the likelihood of melanoma)*:

- **A**symmetry (lack of mirror image in any of the four quadrants)
- Irregular **B**order
- Two or more **C**olours within the lesion
- **D**iameter > 6mm

**PALPATE the individual lesion**

- Surface
- Consistency
- Mobility
- Tenderness
- Temperature

**SYSTEMATIC CHECK**

- Examine the nails, scalp, hair & mucous membranes
- General examination of all systems
Communicating examination findings

- In order to describe, record and communicate examination findings accurately, it is important to learn the appropriate terminology (Tables 3-10).

### Table 3. General terms

<table>

</tbody>
</table>
## Table 5. Configuration (the pattern or shape of grouped lesions)

<table>
<thead>
<tr>
<th>Terms</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discrete</td>
<td>Individual lesions separated from each other</td>
</tr>
<tr>
<td>Confluent</td>
<td>Lesions merging together</td>
</tr>
<tr>
<td>Linear</td>
<td>In a line</td>
</tr>
<tr>
<td>Target</td>
<td>Concentric rings (like a dartboard)</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Erythema multiforme" /></td>
</tr>
<tr>
<td>Annular</td>
<td>Like a circle or ring</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Tinea corporis ('ringworm')" /></td>
</tr>
<tr>
<td>Discoid /</td>
<td>A coin-shaped/round lesion</td>
</tr>
<tr>
<td>Nummular</td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Discoid eczema" /></td>
</tr>
<tr>
<td>Terms</td>
<td>Meaning</td>
</tr>
<tr>
<td>-------</td>
<td>---------</td>
</tr>
<tr>
<td>Erythema</td>
<td>Redness (due to inflammation and vasodilatation) which blanches on pressure. Example: <img src="image" alt="Palmar erythema" /></td>
</tr>
<tr>
<td>Purpura</td>
<td>Red or purple colour (due to bleeding into the skin or mucous membrane) which does not blanch on pressure – petechiae (small pinpoint macules) and ecchymoses (larger bruise-like patches). Example: <img src="image" alt="Henoch-Schönlein purpura" /> (palpable small vessel vasculitis)</td>
</tr>
</tbody>
</table>
**Hypo-pigmentation**

Area(s) of paler skin

Example:

![Pityriasis versicolor](image)

Pityriasis versicolor
(a superficial fungus infection)

**Depigmentation**

White skin due to absence of melanin

Example:

![Vitiligo](image)

Vitiligo
(loss of skin melanocytes)

**Hyper-pigmentation**

Darker skin which may be due to various causes (e.g, post-inflammatory)

Example:

![Melasma](image)

Melasma
(increased melanin pigmentation)
### Table 7. Morphology (the structure of a lesion) – Primary lesions

<table>
<thead>
<tr>
<th>Terms</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Macule</strong></td>
<td>A flat area of altered colour</td>
</tr>
<tr>
<td>Example:</td>
<td><img src="image1" alt="Freckles" /></td>
</tr>
<tr>
<td><strong>Patch</strong></td>
<td>Larger flat area of altered colour or texture</td>
</tr>
<tr>
<td>Example:</td>
<td><img src="image2" alt="Vascular malformation" /></td>
</tr>
<tr>
<td><strong>Papule</strong></td>
<td>Solid raised lesion &lt; 0.5cm in diameter</td>
</tr>
<tr>
<td>Example:</td>
<td><img src="image3" alt="Xanthomata" /></td>
</tr>
</tbody>
</table>
**Nodule**
Solid raised lesion >0.5cm in diameter with a deeper component

Example: (Picture source: D@nderm)

![Pyogenic granuloma (granuloma telangiectaticum)](image)

**Plaque**
Palpable scaling raised lesion >0.5cm in diameter

Example:

![Psoriasis](image)

**Vesicle**
Raised, clear fluid-filled lesion <0.5cm in diameter

*(small blister)*

Example:

![Acute hand eczema (pompholyx)](image)

**Bulla**
Raised, clear fluid-filled lesion >0.5cm in diameter

*(large blister)*

Example:

Reaction to insect bites
**Pustule**  
Pus-containing lesion <0.5 cm in diameter  
Example:

![Acne](image)

**Abscess**  
Localised accumulation of pus in the dermis or subcutaneous tissues  
Example:

![Periungual abscess (acute paronychia)](image)

**W(h)eal**  
Transient raised lesion due to dermal oedema  
Example:

![Urticaria](image)

**Boil/Furuncle**  
Staphylococcal infection around or within a hair follicle

**Carbuncle**  
Staphylococcal infection of adjacent hair follicles (multiple boils/furuncles)
### Table 8. Morphology - Secondary lesions (lesions that evolve from primary lesions)

<table>
<thead>
<tr>
<th>Terms</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excoriation</td>
<td>Loss of epidermis following trauma</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>

<td><img src="image" alt="Excoriations in eczema" /></td>
</tr>
<tr>
<td>Lichenification</td>
<td>Well-defined roughening of skin with accentuation of skin markings</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Lichenification due to chronic rubbing in eczema" /></td>
</tr>
<tr>
<td>Scales</td>
<td>Flakes of stratum corneum</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Psoriasis (showing silvery scales)" /></td>
</tr>
</tbody>
</table>
**Crust**

Rough surface consisting of dried serum, blood, bacteria and cellular debris that has exuded through an eroded epidermis (e.g. from a burst blister)

Example:

![Impetigo](image)

---

**Scar**

New fibrous tissue which occurs post-wound healing, and may be atrophic (thinning), hypertrophic (hyperproliferation within wound boundary), or keloidal (hyperproliferation beyond wound boundary)

Example:

![Keloid scars](image)

---

**Ulcer**

Loss of epidermis and dermis (heals with scarring)

Example:

![Leg ulcers](image)
**Fissure**  
An epidermal crack often due to excess dryness  
Example:

![Image of Fissure](image)

**Striae**  
Linear areas which progress from purple to pink to white, with the histopathological appearance of a scar (associated with excessive steroid usage and glucocorticoid production, growth spurts and pregnancy)  
Example:

![Image of Striae](image)
Table 9. Hair

<td>Punctate depressions of the nail plate (associations include psoriasis, eczema and alopecia areata)</td>
</tr>
</tbody>
</table>
Background Knowledge

- This section covers the basic knowledge of normal skin structure and function required to help understand how skin diseases occur.

Learning outcomes:
1. Ability to describe the functions of normal skin
2. Ability to describe the structure of normal skin
3. Ability to describe the principles of wound healing
4. Ability to describe the difficulties, physical and psychological, that may be experienced by people with chronic skin disease

Functions of normal skin

- These include:
  1) Protective barrier against environmental insults
  2) Temperature regulation
  3) Sensation
  4) Vitamin D synthesis
  5) Immunosurveillance
  6) Appearance/cosmesis

Structure of normal skin and the skin appendages

- The skin is the largest organ in the human body. It is composed of the epidermis and dermis overlying subcutaneous tissue. The skin appendages (structures formed by skin-derived cells) are hair, nails, sebaceous glands and sweat glands.

Epidermis

- The epidermis is composed of 4 major cell types, each with specific functions (Table 11).
Table 11. Main functions of each cell type in the epidermis

<table>
<thead>
<tr>
<th>Cell types</th>
<th>Main functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Keratinocytes</td>
<td>Produce keratin as a protective barrier</td>
</tr>
<tr>
<td>Langerhans’ cells</td>
<td>Present antigens and activate T-lymphocytes for immune protection</td>
</tr>
<tr>
<td>Melanocytes</td>
<td>Produce melanin, which gives pigment to the skin and protects the cell nuclei from ultraviolet (UV) radiation-induced DNA damage</td>
</tr>
<tr>
<td>Merkel cells</td>
<td>Contain specialised nerve endings for sensation</td>
</tr>
</tbody>
</table>

- There are 4 layers in the epidermis (Table 12), each representing a different stage of maturation of the keratinocytes. The average epidermal turnover time (migration of cells from the basal cell layer to the horny layer) is about 30 days.

Table 12. Composition of each epidermal layer

<table>
<thead>
<tr>
<th>Epidermal layers</th>
<th>Composition</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
<tr>
<td>Stratum granulosum</td>
<td>So-called because cells lose their nuclei and contain granules of keratohyaline. They secrete lipid into the intercellular spaces.</td>
</tr>
<tr>
<td>(Granular cell layer)</td>
<td></td>
</tr>
<tr>
<td>Stratum corneum</td>
<td>Layer of keratin, most superficial layer</td>
</tr>
<tr>
<td>(Horny layer)</td>
<td></td>
</tr>
</tbody>
</table>

- In areas of thick skin such as the sole, there is a fifth layer, stratum lucidum, beneath the stratum corneum. This consists of paler, compact keratin.

- Pathology of the epidermis may involve:
  a) changes in epidermal turnover time - e.g. psoriasis (reduced epidermal turnover time)
  b) changes in the surface of the skin or loss of epidermis - e.g. scales, crusting, exudate, ulcer
  c) changes in pigmentation of the skin - e.g. hypo- or hyper-pigmented skin
Dermis

- The dermis is made up of collagen (mainly), elastin and glycosaminoglycans, which are synthesized by fibroblasts. Collectively, they provide the dermis with strength and elasticity.
- The dermis also contains immune cells, nerves, skin appendages as well as lymphatic and blood vessels.
- Pathology of the dermis may involve:
  a) changes in the contour of the skin or loss of dermis e.g. formation of papules, nodules, skin atrophy and ulcers
  b) disorders of skin appendages e.g. disorders of hair, acne (disorder of sebaceous glands)
  c) changes related to lymphatic and blood vessels e.g. erythema (vasodilatation), urticaria (increased permeability of capillaries and small venules), purpura (capillary leakage)

Hair

- There are 3 main types of hair:
  a) lanugo hair (fine long hair in fetus)
  b) vellus hair (fine short hair on all body surfaces)
  c) terminal hair (coarse long hair on the scalp, eyebrows, eyelashes and pubic areas)
- Each hair consists of modified keratin and is divided into the hair shaft (a keratinized tube) and hair bulb (actively dividing cells, and melanocytes which give pigment to the hair).
- Each hair follicle enters its own growth cycle. This occurs in 3 main phases:
  a) anagen (long growing phase)
  b) catagen (short regressing phase)
  c) telogen (resting/shedding phase)
- Pathology of the hair may involve:
  a) reduced or absent melanin pigment production e.g. grey or white hair
  b) changes in duration of the growth cycle e.g. hair loss (premature entry of hair follicles into the telogen phase)
  c) shaft abnormalities
Nails

- The nail is made up of a nail plate (hard keratin) which arises from the nail matrix at the posterior nail fold, and rests on the nail bed.
- The nail bed contains blood capillaries which gives the pink colour of the nails.
- Pathology of the nail may involve:
  a) abnormalities of the nail matrix e.g. pits and ridges
  b) abnormalities of the nail bed e.g. splinter haemorrhage
  c) abnormalities of the nail plate e.g. discoloured nails, thickening of nails

Sebaceous glands

- Sebaceous glands produce sebum via hair follicles (collectively called a pilosebaceous unit). They secrete sebum onto the skin surface which lubricates and waterproofs the skin.
- Sebaceous glands are stimulated by the conversion of androgens to dihydrotestosterone and therefore become active at puberty.
- Pathology of sebaceous glands may involve:
  a) increased sebum production and bacterial colonisation e.g. acne
  b) sebaceous gland hyperplasia

Sweat glands

- Sweat glands regulate body temperature and are innervated by the sympathetic nervous system.
- They are divided into two types: eccrine and apocrine sweat glands.
- Eccrine sweat glands are universally distributed in the skin.
- Apocrine sweat glands are found in the axillae, areolae, genitalia and anus, and modified glands are found in the external auditory canal. They only function from puberty onwards and action of bacteria on the sweat produces body odour.
- Pathology of sweat glands may involve:
  a) inflammation/infection of apocrine glands e.g. hidradenitis suppurativa
  b) overactivity of eccrine glands e.g. hyperhidrosis
### Principles of wound healing

- Wound healing occurs in 4 phases: haemostasis, inflammation, proliferation and remodelling (Table 13).

#### Table 13. Stages of wound healing

<table>
<thead>
<tr>
<th>Stages of wound healing</th>
<th>Mechanisms</th>
</tr>
</thead>
</table>
| **Haemostasis**         | ● Vasoconstriction and platelet aggregation  
                         | ● Clot formation  |
| **Inflammation**        | ● Vasodilatation  
                         | ● Migration of neutrophils and macrophages  
                         | ● Phagocytosis of cellular debris and invading bacteria  |
| **Proliferation**       | ● Granulation tissue formation (synthesised by fibroblasts) and angiogenesis  
                         | ● Re-epithelialisation (epidermal cell proliferation and migration)  |
| **Remodelling**         | ● Collagen fibre re-organisation  
                         | ● Scar maturation  |
Emergency Dermatology

- These are rapidly progressive skin conditions and some are potentially life-threatening. Early recognition is important to implement prompt supportive care and therapy.
- Some are drug reactions and the offending drug should be withdrawn.
- The essential management for all dermatological emergencies, like any emergency, consists of:
  i) full supportive care - ABC of resuscitation
  ii) withdrawal of precipitating agents
  iii) management of associated complications
  iv) specific treatment (highlighted below under each condition)

Learning outcomes:

1. Ability to recognise and describe these skin reactions:
   - urticaria
   - erythema nodosum
   - erythema multiforme

2. Ability to recognise these emergency presentations, discuss the causes, potential complications and provide first contact care in these emergencies:
   - anaphylaxis and angioedema
   - toxic epidermal necrolysis
   - Stevens-Johnson syndrome
   - acute meningococcaemia
   - erythroderma
   - eczema herpeticum
   - necrotising fasciitis
Urticaria, Angioedema and Anaphylaxis

Causes
- Idiopathic, food (e.g. nuts, sesame seeds, shellfish, dairy products), drugs (e.g. penicillin, contrast media, non-steroidal anti-inflammatory drugs (NSAIDs), morphine, angiotensin-converting enzyme inhibitors (ACE-i)), insect bites, contact (e.g. latex), viral or parasitic infections, autoimmune, and hereditary (in some cases of angioedema)

Description
- Urticaria is due to a local increase in permeability of capillaries and small venules. A large number of inflammatory mediators (including prostaglandins, leukotrienes, and chemotactic factors) play a role but histamine derived from skin mast cells appears to be the major mediator. Local mediator release from mast cells can be induced by immunological or non-immunological mechanisms.

Presentation
- Urticaria (swelling involving the superficial dermis, raising the epidermis): itchy wheals
- Angioedema (deeper swelling involving the dermis and subcutaneous tissues): swelling of tongue and lips
- Anaphylaxis (also known as anaphylactic shock): bronchospasm, facial and laryngeal oedema, hypotension; can present initially with urticaria and angioedema

Management
- Antihistamines for urticaria
- Corticosteroids for severe acute urticaria and angioedema
- Adrenaline, corticosteroids and antihistamines for anaphylaxis

Complications
- Urticaria is normally uncomplicated
- Angioedema and anaphylaxis can lead to asphyxia, cardiac arrest and death
Erythema nodosum

Description

• A hypersensitivity response to a variety of stimuli

Causes

• Group A beta-haemolytic streptococcus, primary tuberculosis, pregnancy, malignancy, sarcoidosis, inflammatory bowel disease (IBD), chlamydia and leprosy

Presentation

• Discrete tender nodules which may become confluent
• Lesions continue to appear for 1-2 weeks and leave bruise-like discolouration as they resolve
• Lesions do not ulcerate and resolve without atrophy or scarring
• The shins are the most common site

**Erythema multiforme, Stevens-Johnson syndrome and Toxic epidermal necrolysis**

**Description**

- **Erythema multiforme**, often of unknown cause, is an acute self-limiting inflammatory condition with herpes simplex virus being the main precipitating factor. Other infections and drugs are also causes. Mucosal involvement is absent or limited to only one mucosal surface.

- **Stevens-Johnson syndrome** is characterised by mucocutaneous necrosis with at least two mucosal sites involved. Skin involvement may be limited or extensive. Drugs or combinations of infections or drugs are the main associations. Epithelial necrosis with few inflammatory cells is seen on histopathology. The extensive necrosis distinguishes Stevens-Johnson syndrome from erythema multiforme. Stevens-Johnson syndrome may have features overlapping with toxic epidermal necrolysis including a prodromal illness.

- **Toxic epidermal necrosis** which is usually drug-induced, is an acute severe similar disease characterised by extensive skin and mucosal necrosis accompanied by systemic toxicity. On histopathology there is full thickness epidermal necrosis with subepidermal detachment.

**Management**

- Early recognition and call for help
- Full supportive care to maintain haemodynamic equilibrium

**Complications**

- Mortality rates are 5-12% with SJS and >30% with TEN with death often due to sepsis, electrolyte imbalance or multi-system organ failure

![Erythema multiforme](image1)

![Stevens-Johnson syndrome](image2)
Acute meningococcaemia

**Description**
- A serious communicable infection transmitted via respiratory secretions; bacteria get into the circulating blood

**Cause**
- Gram negative diplococcus Neisseria *meningitides*

**Presentation**
- Features of meningitis (e.g. headache, fever, neck stiffness), septicaemia (e.g. hypotension, fever, myalgia) and a typical rash
- Non-blanching purpuric rash on the trunk and extremities, which may be preceded by a blanching maculopapular rash, and can rapidly progress to ecchymoses, haemorrhagic bullae and tissue necrosis

**Management**
- Antibiotics (e.g. benzylpenicillin)
- Prophylactic antibiotics (e.g. rifampicin) for close contacts (ideally within 14 days of exposure)

**Complications**
- Septicaemic shock, disseminated intravascular coagulation, multi-organ failure and death
Erythroderma (‘red skin’)

**Description**
- Exfoliative dermatitis involving at least 90% of the skin surface

**Causes**
- Previous skin disease (e.g. eczema, psoriasis), lymphoma, drugs (e.g. sulphonamides, gold, sulphonylureas, penicillin, allopurinol, captopril) and idiopathic

**Presentation**
- Skin appears inflamed, oedematous and scaly
- Systemically unwell with lymphadenopathy and malaise

**Management**
- Treat the underlying cause, where known
- Emollients and wet-wraps to maintain skin moisture
- Topical steroids may help to relieve inflammation

**Complications**
- Secondary infection, fluid loss and electrolyte imbalance, hypothermia, high-output cardiac failure and capillary leak syndrome (most severe)

**Prognosis**
- Largely depends on the underlying cause
- Overall mortality rate ranges from 20 to 40%
Eczema herpeticum (Kaposi’s varicelliform eruption)

**Description**
- Widespread eruption - serious complication of atopic eczema or less commonly other skin conditions

**Cause**
- Herpes simplex virus

**Presentation**
- Extensive crusted papules, blisters and erosions
- Systemically unwell with fever and malaise

**Management**
- Antivirals (e.g. aciclovir)
- Antibiotics for bacterial secondary infection

**Complications**
- Herpes hepatitis, encephalitis, disseminated intravascular coagulation (DIC) and rarely, death
Necrotising fasciitis

**Description**
• A rapidly spreading infection of the deep fascia with secondary tissue necrosis

** Causes**
• Group A haemolytic streptococcus, or a mixture of anaerobic and aerobic bacteria
• Risk factors include abdominal surgery and medical co-morbidities (e.g. diabetes, malignancy)
• 50% of cases occur in previously healthy individuals

**Presentation**
• Severe pain
• Erythematous, blistering, and necrotic skin
• Systemically unwell with fever and tachycardia
• Presence of crepitus (subcutaneous emphysema)
• X-ray may show soft tissue gas (absence should not exclude the diagnosis)

**Management**
• Urgent referral for extensive surgical debridement
• Intravenous antibiotics

**Prognosis**
• Mortality up to 76%
Skin Infections / Infestations

- The normal skin microflora and antimicrobial peptides protect the skin against infection. However, when there is skin damage, microorganisms can penetrate resulting in infection.
- There are 3 main types of skin infections according to their sources: bacterial (e.g. staphylococcal and streptococcal), viral (e.g. human papilloma virus, herpes simplex (see page 34) and herpes zoster (see below)), and fungal (e.g. tinea (see page 39 & 40), candida (see page 39 & 40) and yeasts). Infestations (e.g. scabies (see page 58 & 59), lice, cutaneous leishmaniasis) can also occur.

Herpes zoster (shingles) infection due to varicella-zoster virus affecting the distribution of the ophthalmic division of the fifth cranial (trigeminal) nerve

Note: Examination for eye involvement is important

Learning outcomes:

Ability to describe the presentation, investigation and management of:
- cellulitis and erysipelas
- staphylococcal scalded skin syndrome
- superficial fungal infections
Erysipelas and Cellulitis

Description
- Spreading bacterial infection of the skin
- **Cellulitis** involves the deep subcutaneous tissue
- **Erysipelas** is an acute superficial form of cellulitis and involves the dermis and upper subcutaneous tissue

Causes
- Streptococcus pyogenes and Staphylococcus aureus
- Risk factors include immunosuppression, wounds, leg ulcers, toeweb intertrigo, and minor skin injury

Presentation
- Most common in the lower limbs
- Local signs of inflammation – swelling (tumor), erythema (rubor), warmth (calor), pain (dolor); may be associated with lymphangitis
- Systemically unwell with fever, malaise or rigors, particularly with erysipelas
- **Erysipelas** is distinguished from cellulitis by a well-defined, red raised border

Management
- Antibiotics (e.g. flucloxacillin or benzylpenicillin)
- Supportive care including rest, leg elevation, sterile dressings and analgesia

Complications
- Local necrosis, abscess and septicaemia

Cellulitis with elephantiasis of the penis

Erysipelas
Staphylococcal scalded skin syndrome

**Description**
- Commonly seen in infancy and early childhood

**Cause**
- Production of a circulating epidermolytic toxin from phage group II, benzylpenicillin-resistant (coagulase positive) staphylococci

**Presentation**
- Develops within a few hours to a few days, and may be worse over the face, neck, axillae or groins
- A scald-like skin appearance is followed by large flaccid bulla
- Perioral crusting is typical
- There is intraepidermal blistering in this condition
- Lesions are very painful
- Sometimes the eruption is more localised
- Recovery is usually within 5-7 days

**Management**
- Antibiotics (e.g. a systemic penicillinase-resistant penicillin, fusidic acid, erythromycin or appropriate cephalosporin)
- Analgesia
Superficial fungal infections

Description
● A common and mild infection of the superficial layers of the skin, nails and hair, but can be severe in immunocompromised individuals

Cause
● Three main groups: dermatophytes (tinea/ringworm), yeasts (e.g. candidiasis, malassezia), moulds (e.g. aspergillus)

Presentation
● Varies with the site of infection; usually unilateral and itching
  ● Tinea corporis (tinea infection of the trunk and limbs) - Itchy, circular or annular lesions with a clearly defined, raised and scaly edge is typical
  ● Tinea cruris (tinea infection of the groin and natal cleft) – very itchy, similar to tinea corporis
  ● Tinea pedis (athlete’s foot) – moist scaling and fissuring in toeweb, spreading to the sole and dorsal aspect of the foot
  ● Tinea manuum (tinea infection of the hand) – scaling and dryness in the palmar creases
  ● Tinea capitis (scalp ringworm) – patches of broken hair, scaling and inflammation
  ● Tinea unguium (tinea infection of the nail) – yellow discouloration, thickened and crumbly nail
  ● Tinea incognito (inappropriate treatment of tinea infection with topical or systemic corticosteroids) – Ill-defined and less scaly lesions
  ● Candidiasis (candidal skin infection) – white plaques on mucosal areas, erythema with satellite lesions in flexures
  ● Pityriasis/Tinea versicolor (infection with Malassezia furfur) – scaly pale brown patches on upper trunk that fail to tan on sun exposure, usually asymptomatic

Management
● Establish the correct diagnosis by skin scrapings, hair or nail clippings (for dermatophytes); skin swabs (for yeasts)
● General measures: treat known precipitating factors (e.g. underlying immunosuppressive condition, moist environment)
- Topical antifungal agents (e.g. terbinafine cream)
- Oral antifungal agents (e.g. itraconazole) for severe, widespread, or nail infections
- Avoid the use of topical steroids – can lead to tinea incognito
- Correct predisposing factors where possible (e.g. moist environment, underlying immunosuppression)

Tinea corporis

Tinea capitis

Tinea manuum (right hand)

Tinea pedis with associated tinea unguium

Candidiasis (right axilla)

Pityriasis versicolor
Skin Cancer

- Skin cancer is one of the most common cancers.
- In general, skin cancer can be divided into: non-melanoma (basal cell carcinoma and squamous cell carcinoma) and melanoma (malignant melanoma).
- Malignant melanoma is the most life-threatening type of skin cancer and is one of the few cancers affecting the younger population.
- Sun exposure is the single most preventable risk factor for skin cancer.

Learning outcomes:

Ability to recognise:
- basal cell carcinoma
- squamous cell carcinoma
- malignant melanoma
Basal cell carcinoma

**Description**
- A slow-growing, locally invasive malignant tumour of the epidermal keratinocytes normally in older individuals, only rarely metastasises
- Most common malignant skin tumour

**Causes**
- Risk factors include UV exposure, history of frequent or severe sunburn in childhood, skin type I (always burns, never tans), increasing age, male sex, immunosuppression, previous history of skin cancer, and genetic predisposition

**Presentation**
- Various morphological types including nodular (most common), superficial (plaque-like), cystic, morphoeic (sclerosing), keratotic and pigmented
- Nodular basal cell carcinoma is a small, skin-coloured papule or nodule with surface telangiectasia, and a pearly rolled edge; the lesion may have a necrotic or ulcerated centre (rodent ulcer)
- Most common over the head and neck

**Management**
- Surgical excision - treatment of choice as it allows histological examination of the tumour and margins
- Mohs micrographic surgery (i.e. excision of the lesion and tissue borders are progressively excised until specimens are microscopically free of tumour) - for high risk, recurrent tumours
- Radiotherapy - when surgery is not appropriate
- Other e.g. cryotherapy, curettage and cautery, topical photodynamic therapy, and topical treatment (e.g. imiquimod cream) - for small and low-risk lesions

**Complications**
- Local tissue invasion and destruction

**Prognosis**
- Depends on tumour size, site, type, growth pattern/histological subtype, failure of previous treatment/recurrence, and immunosuppression

Basal cell carcinoma – nodular type
Squamous cell carcinoma

Description
- A locally invasive malignant tumour of the epidermal keratinocytes or its appendages, which has the potential to metastasise

Causes
- Risk factors include excessive UV exposure, pre-malignant skin conditions (e.g. actinic keratoses), chronic inflammation (e.g. leg ulcers, wound scars), immunosuppression and genetic predisposition

Presentation
- Keratotic (e.g. scaly, crusty), ill-defined nodule which may ulcerate

Management
- Surgical excision - treatment of choice
- Mohs micrographic surgery – may be necessary for ill-defined, large, recurrent tumours
- Radiotherapy - for large, non-resectable tumours

Prognosis
- Depends on tumour size, site, histological pattern, depth of invasion, perineural involvement, and immunosuppression

Squamous cell carcinoma – adjacent to ear (left) and glans penis (right)
Malignant melanoma

**Description**
- An invasive malignant tumour of the epidermal melanocytes, which has the potential to metastasise

**Causes**
- Risk factors include excessive UV exposure, skin type I (always burns, never tans), history of multiple moles or atypical moles, and family history or previous history of melanoma

**Presentation**
- The ‘ABCDE Symptoms’ rule (*major suspicious features):
  - Asymmetrical shape*
  - Border irregularity
  - Colour irregularity*
  - Diameter > 6mm
  - Evolution of lesion (e.g. change in size and/or shape)*
- Symptoms (e.g. bleeding, itching)
- More common on the legs in women and trunk in men

**Types**
- Superficial spreading melanoma – common on the lower limbs, in young and middle-aged adults; related to intermittent high-intensity UV exposure; around 70% of all melanomas are superficial spreading melanomas
- Nodular melanoma - common on the trunk, in young and middle-aged adults; related to intermittent high-intensity UV exposure
- Lentigo maligna melanoma - common on the face, in elderly population; related to long-term cumulative UV exposure
- Acral lentiginous melanoma - common on the palms, soles and nail beds, in elderly population; no clear relation with UV exposure

**Management**
- Depends on the staging of melanoma (currently used system in the UK - 2009 American Joint Committee of Cancer Staging System (AJCC)). Stages I-IV are based on primary tumour Breslow thickness, lymph node involvement and evidence of metastases. Stage I is the earliest and stage IV is the most advanced
- In general, surgical excision is the definitive treatment (often a second surgery, wide local excision is needed after the initial
excision biopsy). Radiotherapy may sometimes be useful. Chemotherapy is used for metastatic disease.

**Prognosis**

- Prognosis depends on the stage of melanoma and Breslow thickness.
- In general, 90% of people diagnosed with melanoma in England and Wales survived 10 years or more (Cancer Research UK, 2010-2011).

**Further reading:** British Association of Dermatologists. Revised UK guidelines for the management of cutaneous melanoma 2010. [https://www.bad.org.uk/library-media%5Cdocuments%5CMelanoma_2010.pdf](https://www.bad.org.uk/library-media%5Cdocuments%5CMelanoma_2010.pdf)
Inflammatory Skin Conditions

- Eczema, acne and psoriasis are chronic inflammatory skin disorders that follow a relapsing and remitting course. There are many types of eczema but we shall just consider atopic eczema here.
- These skin disorders are not infectious.
- Management is aimed at achieving control and not providing a cure.
- Complications are mainly due to the psychological and social effects.
- Patient education is important in these chronic skin conditions and should concentrate on providing information about the nature of condition, aims of treatment and the available treatment options.

Learning outcomes:

Ability to describe the presentation, demonstrate assessment, formulate a differential diagnosis, instigate investigation and discuss how to provide continuing care of:
- atopic eczema
- acne
- psoriasis
Atopic eczema

Description
- Eczema (or dermatitis) is characterized by papules and vesicles on an erythematous base
- **Atopic eczema** is the most common type - usually develops by early childhood and resolves during teenage years (but may recur)

Epidemiology
- 20% prevalence in <12 years old in the UK

Causes
- Not fully understood, but a positive family history of atopy (i.e. eczema, asthma, allergic rhinitis) is often present
- A primary genetic defect in skin barrier function (loss of function variants of the protein filaggrin) appears to underlie atopic eczema
- Exacerbating factors such as infections, allergens (e.g. chemicals, food, dust, pet fur), sweating, heat and severe stress

Presentation
- Commonly present as itchy, erythematous dry scaly patches
- More common on the face and extensor aspects of limbs in infants, and the flexor aspects in children and adults
- Acute lesions are erythematous, vesicular and weepy (exudative)
- Chronic scratching/rubbing can lead to excoriations and lichenification
- May show nail pitting and ridging of the nails

Management
- General measures - avoid known exacerbating agents, frequent emollients +/- bandages and bath oil/soap substitute
- Topical therapies – topical steroids for flare-ups; topical immunomodulators (e.g. tacrolimus, pimecrolimus) can be used as steroid-sparing agents
- Oral therapies - antihistamines for symptomatic relief, antibiotics (e.g. flucloxacillin) for secondary bacterial infections, and antivirals (e.g. aciclovir) for secondary herpes infection
- Phototherapy and immunosuppressants (e.g. oral prednisolone, azathioprine, ciclosporin) for severe non-responsive cases

Complications
- Secondary bacterial infection (crusted weepy lesions)
- Secondary viral infection - molluscum contagiosum (pearly papules with central umbilication), viral warts and eczema herpeticum (see page 34)
Atopic eczema

**Acne vulgaris**

**Description**  
- An inflammatory disease of the pilosebaceous follicle

**Epidemiology**  
- Over 80% of teenagers aged 13-18 years

**Causes**  
- Hormonal (androgen)
- Contributing factors include increased sebum production, abnormal follicular keratinization, bacterial colonization (*Propionibacterium acnes*) and inflammation

**Presentation**  
- Non-inflammatory lesions (mild acne) - open and closed comedones (blackheads and whiteheads)
- Inflammatory lesions (moderate and severe acne) - papules, pustules, nodules, and cysts
- Commonly affects the face, chest and upper back

**Management**  
- General measures - no specific food has been identified to cause acne, treatment needs to be continued for at least 6 weeks to produce effect
- Topical therapies (for mild acne) - benzoyl peroxide and topical antibiotics (antimicrobial properties), and topical retinoids (comedolytic and anti-inflammatory properties)
- Oral therapies (for moderate to severe acne) - oral antibiotics, and anti-androgens (in females)
- Oral retinoids (for severe acne)

**Complications**  
- Post-inflammatory hyperpigmentation, scarring, deformity, psychological and social effects
Psoriasis

Description
• A chronic inflammatory skin disease due to hyperproliferation of keratinocytes and inflammatory cell infiltration

Types
• Chronic plaque psoriasis is the most common type
• Other types include guttate (raindrop lesions), seborrhoeic (nasolabial and retroauricular), flexural (body folds), pustular (palmar-plantar), and erythrodermic (total body redness)

Epidemiology
• Affects about 2% of the population in the UK

Causes
• Complex interaction between genetic, immunological and environmental factors
• Precipitating factors include trauma (which may produce a Köebner phenomenon), infection (e.g. tonsillitis), drugs, stress, and alcohol

Presentation
• Well-demarcated erythematous scaly plaques
• Lesions can sometimes be itchy, burning or painful
• Common on the extensor surfaces of the body and over scalp
• Auspitz sign (scratch and gentle removal of scales cause capillary bleeding)
• 50% have associated nail changes (e.g. pitting, onycholysis)
• 5-8% suffer from associated psoriatic arthropathy - symmetrical polyarthritis, asymmetrical oligomonarthritis, lone distal interphalangeal disease, psoriatic spondylitis, and arthritis mutilans (flexion deformity of distal interphalangeal joints)

Management
• General measures - avoid known precipitating factors, emollients to reduce scales
• Topical therapies (for localised and mild psoriasis) - vitamin D analogues, topical corticosteroids, coal tar preparations, dithranol, topical retinoids, keratolytics and scalp preparations
• Phototherapy (for extensive disease) - phototherapy i.e. UVB and photochemotherapy i.e. psoralen+UVA
• Oral therapies (for extensive and severe psoriasis, or psoriasis with systemic involvement) - methotrexate, retinoids, ciclosporin, mycophenolate mofetil, fumaric acid esters,
Inflammatory Skin Conditions – Psoriasis

and biological agents (e.g. etanercept, adalimumab, ustekinumab)

(see page 70)

Complications

- Erythroderma (see page 33), psychological and social effects

Köebner phenomenon

Plaque psoriasis

Nail changes and arthropathy

Scalp involvement
Blistering Disorders

• In general, blistering skin disorders can be divided into: immunobullous diseases (e.g. bullous pemphigoid, pemphigus vulgaris), blistering skin infections (e.g. herpes simplex) and other (e.g. porphyria cutanea tarda).

• The fragility of blisters depends on the level of split within the skin – an intraepidermal split (a split within the epidermis) causes blisters to rupture easily; whereas a sub-epidermal split (a split between the epidermis and dermis) causes blisters to be less fragile.

• The common causes of blisters are impetigo (see below), insect bites, herpes simplex infection (see page 34), herpes zoster infection (see page 36), acute contact dermatitis, pompholyx (vesicular eczema of the hands and feet, see below) and burns.

• Bullous pemphigoid (see page 53) and pemphigus vulgaris (see page 54) are uncommon conditions due to immune reaction within the skin.

Learning outcomes:

1. Ability to recognise common causes of blisters

2. Ability to recognise:
   - Bullous pemphigoid
   - Pemphigus vulgaris
Bullous pemphigoid

**Description**
- A blistering skin disorder which usually affects the elderly

**Cause**
- Autoantibodies against antigens between the epidermis and dermis causing a sub-epidermal split in the skin

**Presentation**
- Tense, fluid-filled blisters on an erythematous base
- Lesions are often itchy
- May be preceded by a non-specific itchy rash
- Usually affects the trunk and limbs (mucosal involvement less common)

**Management**
- General measures – wound dressings where required, monitor for signs of infection
- Topical therapies for localised disease - topical steroids
- Oral therapies for widespread disease – oral steroids, combination of oral tetracycline and nicotinamide, immunosuppressive agents (e.g. azathioprine, mycophenolate mofetil, methotrexate, and other)
**Pemphigus vulgaris**

**Description**
- A blistering skin disorder which usually affects the middle-aged

**Cause**
- Autoantibodies against antigens within the epidermis causing an intra-epidermal split in the skin

**Presentation**
- Flaccid, easily ruptured blisters forming erosions and crusts
- Lesions are often painful
- Usually affects the mucosal areas (can precede skin involvement)

**Management**
- General measures – wound dressings where required, monitor for signs of infection, good oral care (if oral mucosa is involved)
- Oral therapies – high-dose oral steroids, immunosuppressive agents (e.g. methotrexate, azathioprine, cyclophosphamide, mycophenolate mofetil, and other)
Common Important Problems

- There are several commonly-encountered skin problems in clinical practice. Below are some of the important differential diagnoses for each of these presentations.
- Clinical exposure is the key to achieve competence in diagnosing, investigating and managing these skin problems.

Learning objectives:

Ability to formulate a differential diagnosis, describe the investigation and discuss the management in patients with:
- chronic leg ulcers
- itchy eruption
- a changing pigmented lesion
- purpuric eruption
- a red swollen leg
Chronic leg ulcers

- Leg ulcers are classified according to aetiology. In general, there are three main types: venous, arterial and neuropathic ulcers. Other causes include vasculitic ulcers (purpuric, punched out lesions), infected ulcers (purulent discharge, may have systemic signs) and malignancy (e.g. squamous cell carcinoma in long-standing non-healing ulcers).
- In clinical practice, there can be mixture of arterial, venous and/or neuropathic components in an ulcer.
## Chronic leg ulcers

Itchy eruption

- An itchy (pruritic) eruption can be caused by an inflammatory condition (e.g. eczema), infection (e.g. varicella), infestation (e.g. scabies), allergic reaction (e.g. some cases of urticaria) or an unknown cause, possibly autoimmune (e.g. lichen planus).
## Itchy eruption

| **Management** | - Rarely needed                      | - Rarely needed                 | - Excision                          |
Purpuric eruption

- A purpuric eruption can be thrombocytopenic (e.g. meningococcal septicaemia, disseminated intravascular coagulation, idiopathic thrombocytopenic purpura) or non-thrombocytopenic e.g. trauma, drugs (e.g. steroids), aged skin, vasculitis (e.g. Henoch-Schönlein purpura).

- Platelet counts and a clotting screen are important to exclude coagulation disorders.
### Purpuric eruption

**Management**

- Treatment modalities for skin disease can be broadly categorised into medical therapy (topical and systemic treatments) and physical therapy (e.g. cryotherapy, phototherapy, photodynamic therapy, lasers and surgery).
- Topical treatments directly deliver treatment to the affected areas and this reduces systemic side effects. It is suitable for localised and less severe skin conditions. They consist of active constituents which are transported into the skin by a base (also known as a ‘vehicle’). Examples of active ingredients are steroids, tar, immunomodulators, retinoids, and antibiotics. The common forms of base are lotion (liquid), cream (oil in water), gel (organic polymers in liquid, transparent), ointment (oil with little or no water) and paste (powder in ointment).
- Systemic therapy is used for extensive and more serious skin conditions, if the treatment is ineffective topically or if there is systemic involvement. However, they have the disadvantage of causing systemic side effects.

**Learning objectives:**

*Ability to describe the principles of use of the following drugs:*
- emollients
- topical/oral corticosteroids
- oral aciclovir
- oral antihistamines
- topical/oral antibiotics
- topical antiseptics
- biological therapy
Emollients

Examples
- Aqueous cream, emulsifying ointment, liquid paraffin and white soft paraffin in equal parts (50:50)

Quantity
- 500 grams per tub

Indications
- To rehydrate skin and re-establish the surface lipid layer
- Useful for dry, scaling conditions and as soap substitutes

Side effects
- Reactions may be irritant or allergic (e.g. due to preservatives or perfumes in creams)

Topical/Oral corticosteroids

Examples
- Topical steroids: classified as mildly potent (e.g. hydrocortisone), moderately potent (e.g. clobetasone butyrate (*Eumovate*)), potent (e.g. betamethasone valerate (*Betnovate*)), and very potent (e.g. clobetasol propionate (*Dermovate*))
- Oral steroids: prednisolone

Quantity
- Usually 30 grams per tube (enough to cover the whole body once)

Indications
- Anti-inflammatory and anti-proliferative effects
- Useful for allergic and immune reactions, inflammatory skin conditions, blistering disorders, connective tissue diseases, and vasculitis

Side effects
- Local side effects (from topical corticosteroids): skin atrophy (thinning), telangiectasia, striae, may mask, cause or exacerbate skin infections, acne, or perioral dermatitis, and allergic contact dermatitis.
- Systemic side effects (from oral corticosteroids): Cushing’s syndrome, immunosuppression, hypertension, diabetes, osteoporosis, cataract, and steroid-induced psychosis

Oral aciclovir

Examples
- Aciclovir

Indications
- Viral infections due to herpes simplex and herpes zoster virus

Side effects
- Gastrointestinal upsets, raised liver enzymes, reversible neurological reactions, and haematological disorders

Oral antihistamines

Examples
- Classified into non-sedative (e.g. cetirizine, loratadine) and sedative
antihistamines (e.g. chlorpheniramine, hydroxyzine)

**Indications**
- Block histamine receptors producing an anti-pruritic effect
- Useful for type-1 hypersensitivity reactions and eczema (especially sedative antihistamines for children)

**Side effects**
- Sedative antihistamines can cause sedation and anticholinergic effects (e.g. dry mouth, blurred vision, urinary retention, and constipation)

**Topical/Oral antibiotics**

**Examples**
- Topical antibiotics: fusidic acid, mupirocin (*Bactroban*), neomycin
- Oral antibiotics: penicillins, cephalosporins, gentamicin, macrolides, nitrofurantoin, quinolones, tetracyclines, vancomycin, metronidazole, trimethoprim

**Indications**
- Useful for bacterial skin infections, and some are used for acne

**Side effects**
- Local side effects (from topical antibiotics): local skin irritation/allergy
- Systemic side effects (from oral antibiotics): gastrointestinal upset, rashes, anaphylaxis, vaginal candidiasis, antibiotic-associated infection such as *Clostridium difficile*, and antibiotic resistance (rapidly appears to fusidic acid)

**Topical antiseptics**

**Examples**
- Chlorhexidine, cetrimide, povidone-iodine

**Indications**
- Treatment and prevention of skin infection

**Side effects**
- Local side effects: local skin irritation/allergy

**Oral retinoids**

**Examples**
- Isotretinoin, Acitretin

**Indications**
- Acne, psoriasis, and disorders of keratinisation

**Side effects**
- Mucocutaneous reactions such as dry skin, dry lips and dry eyes, disordered liver function, hypercholesterolaemia, hypertriglyceridaemia, myalgia, arthralgia and depression
- Teratogenicity: effective contraception must be practised one month before, during and at least one month after isotretinoin, but for two years after Acitretin (consult current BNF for further details)
**Biological Therapy**

**Examples**
- Monoclonal antibodies (eg. Infliximab, Adalimumab, Ustekinumab, Certolizumab, Gorililumab), Fusion antibody proteins (eg. Etanercept), Recombinant human cytokines and growth factors (eg. Interleukins)

**Indications**
- Mainly for psoriasis, atopic dermatitis and hidradenitis suppurativa

**Side effects**
- Local side effects: redness, swelling, bruising at the site of injection
- Systemic side effects: allergic reactions, antibody formation, flu-like symptoms, infections, hepatitis, demyelinating disease, heart failure, blood problems, rare reports of cancers (eg. non-melanoma skin cancers, lymphoma)
Practical Skills

- There are four main aspects to focus on in clinical practice:
  i) Patient education, particularly on the nature of disease, treatment and ways to achieve full compliance and effectiveness, and prevention strategies
  ii) Effective written communication to general practitioner so that patient care can be continued appropriately
  iii) Good prescribing skills
  iv) Good clinical examination and appropriate investigations to facilitate accurate diagnosis

Learning objectives:

1. Ability to perform the following tasks:
   - explain how to use an emollient or a topical corticosteroid
   - make a referral
   - write a discharge letter
   - write a prescription for emollient
   - take a skin swab
   - take a skin scrape
   - measure the ankle-brachial pressure index and interpret the result

2. Describe the principles of prevention in:
   - pressure sores
   - sun damage and skin cancer

Patient education

How to use emollients

- Apply liberally and regularly
How to use topical corticosteroids

- Apply thinly and only for short-term use (often 1 or 2 weeks only)
- In general, use 1% hydrocortisone or mild-moderate potent topical steroids on the face and thin skin areas eg. neck and flexures.
- Fingertip unit (advised on packaging) – strip of cream the length of a fingertip

Preventing pressure sores

- Pressure sores are due to ischaemia resulting from localised damage to the skin caused by sustained pressure, friction and moisture, particularly over bony prominences.
- Preventative measures involve frequent repositioning, nutritional support, and use of pressure relieving devices e.g. special beds

Preventing sun damage and skin cancer

- Excessive exposure to UV radiation is the most significant and preventable risk factor for the development of skin cancer (Table 14)
- Skin types I and II are at higher risk of developing skin cancer with excessive sun exposure than other skin types (Table 15)

Table 14. SMART ways to avoid excessive sun exposure

- Spend time in the shade between 11am-3pm
- Make sure you never burn
- Aim to cover up with a t-shirt, wide-brimmed hat and sunglasses
- Remember to take extra care with children
- Then use Sun Protection Factor (SPF) 30+ sunscreen

Table 15. Skin types

<table>
<thead>

</thead>
<tbody>
<tr>
<td>I</td>
<td>Always burns, never tans</td>
</tr>
<tr>
<td>II</td>
<td>Always burns, sometimes tans</td>
</tr>
<tr>
<td>III</td>
<td>Sometimes burns, always tans</td>
</tr>
<tr>
<td>IV</td>
<td>Never burns, always tans</td>
</tr>
</tbody>
</table>
Written communication

Writing a referral letter

*Important points to include:*
- Reason(s) for referral, current presentation, and impact of disease
- Patient’s medical and social background
- Current and previous treatment, length of treatment, and response to treatment

Writing a discharge letter

*Important points to include:*
- Reason(s) for admission and current presentation
- Hospital course
- Investigation results
- Diagnostic impression
- Management plan (including treatment and follow-up appointment)
- Content of patient education given

Prescribing skills

Writing a prescription

*General tips:*
- Include drug name, dose, frequency and an intended duration/review date
- 30 grams of cream/ointment covers the whole adult body area
- 1 fingertip unit covers the area of two palms and equals ½ gram

Prescribing emollients

*General tips*
- Emollients come in 500 gram tubs
- In general, ointment-based emollients are useful for dry, scaling skin whereas creams and lotions are for red, inflamed and weeping lesions
Prescribing topical corticosteroids

*General tips*

- Prescribe the weakest potency corticosteroid that is effective
- Use only for short term
- Need to specify the base i.e. cream, lotion or ointment

**Clinical examination and investigations**

**Taking a skin swab**

- Skin swabs can be taken from vesicles, pustules, erosions, ulcers and mucosal surfaces for microbial culture.
- Surface swabs are generally not encouraged.

**Taking a skin scrape**

- Skin scrapes are taken from scaly lesions by gentle use of a scalpel in suspected fungal infection (to show evidence of fungal hyphae and/or spores) and from burrows in scabies *(see page 59).*

**Measuring ankle-brachial pressure index (ABPI)**

- ABPI is used to identify the presence and severity of peripheral arterial insufficiency, which is important in the management of leg ulcers.
- Measure the cuff pressure of dorsalis pedis or posterior tibial artery using a Doppler and compare it to the pressure of brachial artery.
- The ABPI is measured by calculating the ratio of highest pressure obtained from the ankle to highest brachial pressure of the two arms, and is normally >0.8.
- Inappropriately high reading will be obtained in calcified vessels (often in diabetics).
